                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Substitution of residue 378 of the elongation factor (EF-Tu) with a valine, threonine, proline or phenyalanine results in an elfamycin resistant protein (EF-TuR). The advantage of this change is that the limiting factor for the prodn. of elfamycin by actinomycetes is removed by mutating the gene tuf into tuff encoding a protein resistant to an elfamycin, pref. mocimycin (kircomycin). The inventors claim EF-TuR and the genes (tufk) encoding it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CACGTCGACTGCCCCGGCCACGCCGACTATGTCAAGAATATGATCACCGGCGCTGCGCAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for generating a reperiory or nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microrganisms e.g. algae, archaea, bacteria, fungil and parasitical species, ganus, family and group. A nucleic acid (1) and parasitical species, ganus, family and group. A nucleic acid (1) and parasitical species, ganus, family and group. A nucleic acid (1) and parasitical species, ganus, family and group. A nucleic acid (1) and parasitical species, ganus, family and group. A nucleic acid (1) detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at at least one toxin gene. hexA nucleic acids are used for the specific and ubquitous detection and for identification of Streptococcus pneumoniae. (1) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Corynebacteriaceae family, Pseudomonads group, Streptococcus sp., Corynebacteriaceae family, Pseudomonads group, Streptococcus sp., Naisseria gonornhoeae and Stabhjoroccus sp., Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5
                                                                                                                                                                                                                                                                                                                                                                                                                                                           primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention describes a method for generating a repertory of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the ancoded proteins. The prokaryotes used are Escherichia coli, Staphylococus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonnas aeruginosa and Enterococus faccalis. The proteinoniae, Pseudomonnas aeruginosa and Enterococus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to intended to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Sesential prokaryotic cellular proliferation protein.

Oute: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic for the control of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .;

```

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are bechariotic speudonas aeruqinosa and Enterococcus facellis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to adentify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Carr GJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 23; Length 1230;

/note="Wector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: Ecoth: Site_2: Xho1; Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab): Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled from the two
samples, polyA was purified from the pooled RNA, a cDNA
library was made, and the cDNA clones were in vivo
excised to give pBluescript phagemids in the TJ Close lab
at the University of California, Riverside (Akhunov, Chin
Plasmid DNA preparations and DNA sequencing were
performed in the OD Anderson lab (all other authors)."

/note="Vector: lambdaZAP; Site_1: EcoR1; Site_2: Xhol; Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 90% RH for 24 hr. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, YU, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or breath and sequence has been trimmed to sequence and contains and sequence has been trimmed to sequence and contains and sequence has been trimmed to sequence and contains a minimum of 100 bases of phred value 20 or

Site_1: EcoroR; Site_2: Xho!; Plants were grown under
Nydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab). Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled RNA, a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; Pooideae; Triticeae; Triticeae.

/note="Vector: Lambda Uni ZAP XR, excised phagemid;
Site_1: EcoRI: Site_2: XhoI; Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab). Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled RNA, a cDNA
library was made, and the cDNA clones were in vivo
excised to give pBluescript phagemids in the TJ close lab
at the University of California, Riverside (Akhunov, Chin
/ Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequencing were
performed in the OD Anderson lab (all other authors)."

/lab.host—"TJC121"
//note—"Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: Xhoi; Plants were grown at Washington State University, Pullman, WA in a greenhouse, the rachises were excised and frozen in liquid nitrogen (Kleinhofs lab). In the TJ Close lab at the University of California, Riverside total RNA was prepared, poly(A) was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, YU, Frisch, Henry, Simmons, Rambo, Main). The sequence has been trimmed to remove vector sequence and eabove. For more details on library preparation and

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
